CONTENTS

- A. General description of CDM programme activity (CPA)
- B. Eligibility of CPA and Estimation of Emission Reductions
- C. Environmental Analysis
- D. Stakeholder comments

Annexes

Annex 1: Contact information on entity/individual responsible for the CPA

Annex 2: Information regarding public funding

Annex 3: Baseline information

Annex 4: Monitoring plan

NOTE:

- (i) This form is for submission of CPAs that apply a small scale approved methodology using the provision of the proposed small scale CDM PoA.
- (ii) The coordinating/managing entity shall prepare a CDM Small Scale Programme Activity Design Document (CDM-SSC-CPA-DD)^{1,2} that is specific to the proposed PoA by using the provisions stated in the SSC PoA DD. At the time of requesting registration the SSC PoA DD must be accompanied by a CDM-SSC CPA-DD form that has been specified for the proposed SSC PoA, as well as by one completed CDM-SSC CPA-DD (using a real case). After the first CPA, every CPA that is added over time to the SSC PoA must submit a completed CDM-SSC CPA-DD.

¹ The latest version of the template form CDM-CPA-DD is available on the UNFCCC CDM web site in the reference/document section.

² At the time of requesting validation/registration, the coordinating managing entity is required to submit a completed CDM-POA-DD, the PoA specific CDM-CPA-DD, as well as a completed CDM-CPA-DD (using a real case).

NAME /TITLE OF THE PoA:

Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 2

SECTION A. General description of small scale CDM programme activity (CPA)

A.1. Title of the small-scale CPA:

Installing Solar Water Heating Systems in (Name of province), Viet Nam

Version XX

(Date of completion)

A.2. Description of the small-scale CPA:

The purpose of this proposed small-scale CDM Programme Activity (hereafter referred to as “CPA”) is to install new solar water heating (SWH) systems in provinces in south of Viet Nam through a subsidy programme coordinated by the Energy Conservation Center of Ho Chi Minh City. The cost of the SWH systems will be subsidised as an incentive to encourage people to install SWH systems. The SWH systems will reduce demand for electricity used for heating water, thereby reducing emissions of greenhouse gases (GHG).

With the rapid growth of the economy in Viet Nam, electricity demand is increasing. The Vietnamese Government estimated the annual growth in electricity demand to be about 11% from 2005 to 2010. About half of the electricity distributed by Electricity of Viet Nam (EVN) is sold to households. Along with the rapid economic growth, home electronics, such as televisions, air-conditioners and electronic water heaters have become widely used among Vietnamese people. Especially in urban areas, electric water heaters are commonly used for providing hot water for showers and the electricity consumed for water heating accounts about 15% of the total electricity consumption of one family. Therefore, implementation of energy saving measures for electricity consumption from water heating is an important task in Viet Nam.

The coordinating entity of the proposed CPA is the Energy Conservation Center (ECC) of Ho Chi Minh City. The ECC is aiming to install a certain number of SWH systems into households, kindergartens and small hotels in a province, or a number of provinces located in the south of Viet Nam under the CPA.

Through the CPA, the energy demand for providing heated water will come from solar energy, a renewable resource with no GHG emissions. This energy will displace electricity which would have been consumed from the Vietnamese national grid. GHGs associated with electricity production will be reduced as a result.

This CPA will contribute to the sustainable development of Viet Nam in the following ways:

Economic dimension –Current electricity supply is not enough to meet projected demand especially in the southern region of Viet Nam. The Vietnamese Government is promoting energy conservation as well as expanding the electric supply capacity in order to support the rapid development of the economy. The CPA will reduce energy consumption for water heating for household use in the south of Viet Nam and help secure the electricity supply required for the country’s continued economic growth.

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:

Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 3

Environmental dimension – The Programme Activity reduces electricity consumption by providing energy savings, and thereby reducing the amount of greenhouse gases (GHG) produced by fossil fuel combustion at the national electricity grid. Through promotional activities in the mass media such as television and newspaper advertisements to enhance the use of SWH systems, the ECC will communicate the economic and environmental benefits of the SWH systems. This publicity will widely raise awareness of renewable energy and energy conservation among the Vietnamese people.

Social dimension – The use of electric water heaters in the bathroom sometimes causes electric shock, which is a common concern for people who have small children. The introduction of SWH systems will provide a safe and steady supply of hot water and hence increase the quality of life of people in Viet Nam.

Through the programme jobs will be created in the solar sector, with training provided for technicians to install and maintain the SWH systems.

A.3. Entity/individual responsible for the small-scale CPA:

The coordinating entity for this CPA is the Energy Conservation Center (ECC) – Ho Chi Minh City

A.4. Technical description of the small-scale CPA:

A.4.1. Identification of the small-scale CPA:

A.4.1.1. Host Party:

Socialist Republic of Viet Nam

A.4.1.2. Geographic reference or other means of identification allowing the unique identification of the small-scale CPA (maximum one page):

The geographic boundary of the proposed CPA is the boundary of a province, or a number of provinces located in the south of Viet Nam.

A.4.2. Duration of the small-scale CPA:

A.4.2.1. Starting date of the small-scale CPA:

The starting date of the CPA is the date when the first SWH systems of the proposed CPA are installed.

A.4.2.2. Expected operational lifetime of the small-scale CPA:

15 Years

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:

Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 4

A.4.3. Choice of the crediting period and related information:

Renewable crediting period

A.4.3.1. Starting date of the crediting period:

Date of registration

A.4.3.2. Length of the crediting period, first crediting period if the choice is renewable CP:

7 Years

A.4.4. Estimated amount of emission reductions over the chosen crediting period:

Year	Annual estimation of emission reductions in tonnes of CO ₂ e
1	
2	
3	
4	
5	
6	
7	
Total estimated reductions (tCO₂e)	
Total number of crediting years	
Annual average over the crediting period of estimated reductions (tCO₂e)	

A.4.5. Public funding of the CPA:

This proposed CPA will not receive any public funds resulting from official development assistance from Parties included in Annex I to the Convention.

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:

Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 5

A.4.6. Information to confirm that the proposed small-scale CPA is not a de-bundled component

The proposed CPA is not a de-bundled component of a large scale activity. There is no other activity³ which has the ECC as the activity implementer, nor has the ECC as a coordinating or managing entity of a large scale Programme of Activities (PoA)⁴ of the same sectoral scope.

A.4.7. Confirmation that the small-scale CPA is neither registered as an individual CDM project activity nor is part of another Registered PoA:

The proposed CPA is neither registered as an individual project activity, nor is it part of any other Registered PoA.

SECTION B. Eligibility of small-scale CPA and Estimation of emissions reductions

B.1. Title and reference of the Registered PoA to which small-scale CPA is added:

Installing Solar Water Heating Systems in the South of Viet Nam

Version 01

13 February 2009

B.2. Justification of the why the small-scale CPA is eligible to be included in the Registered PoA :

This proposed CPA meets eligibility criteria for inclusion of the CPA described in Section A.4.2.2 of the CDM-SSC-PoA-DD:

- This CPA will install new SWH systems in a province located in the South of Viet Nam.
- This CPA will be coordinated by the ECC.
- The SWH systems under this CPA are installed by suppliers certified by the ECC
- The SWH systems under this CPA are registered under the installation program of the ECC.
- The SWH systems under the CPA has a tank capacity at least 180L.
- This CPA applies the same technology and baseline and monitoring methodology, AMS-I.C., as other CPA of the registered PoA.
- This CPA applies the same baseline scenario as other CPAs of the registered PoA, that is, the use of electricity from the grid for providing heated water.

³ Which may be a (i) registered small-scale CPA of a PoA, (ii) an application to register another small-scale CPA of a PoA or (iii) another registered CDM project activity

⁴ Only those PoAs need to be considered in determining de-bundling that are: (i) in the same geographical area; and (ii) use the same methodology; as the PoA to which proposed CPA is being added

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:
Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 6

B.3. Assessment and demonstration of additionality of the small-scale CPA, as per eligibility criteria listed in the Registered PoA:

The proposed CPA fulfils key criteria for assessing additionality listed in Section E.5.2 of the CDM-SSC-PoA-DD:

- No national and local laws and regulations requiring use of SWH systems.
- The proposed SSC-CPA requires the financial resources leveraged by registration as a CPA under the registered PoA.
- The proposed SSC-CPA requires the technical assistance of the ECC in the installation and maintenance of the SWH systems.
- The proposed SSC-CPA demonstrates that the use of SWH systems is not common practice within the CPA boundary.

B.4. Description of the sources and gases included in the project boundary and proof that the small-scale CPA is located within the geographical boundary of the registered PoA.

The gas reduced through this CPA is CO₂. The CPA reduces electricity consumption by providing energy via SWH systems. The reduced electricity demand thereby reduces the amount of CO₂ produced by fossil fuel combustion to the electricity grid.

	Source	Gas	Included?	Justification/Explanation
Baseline	Electricity consumption/ Heat generation	CO ₂	Included	Heating water consumes electricity, which had been sourced from the national electricity grid.
		CH ₄	Excluded	Excluded for simplification. This is conservative.
		N ₂ O	Excluded	Excluded for simplification. This is conservative.
Project	Heat generation	CO ₂	Excluded	Heat will be displaced by solar energy, which is a renewable source. According to AMS-I.C., project emissions from a renewable source can be excluded.
		CH ₄	Excluded	Excluded for simplification.
		N ₂ O	Excluded	Excluded for simplification.

B.5. Emission reductions:

B.5.1. Data and parameters that are available at validation:

Data / Parameter:	EF_{EL,y}
Data unit:	(tCO ₂ /MWh)
Description:	Emission factor for electricity generation for source <i>k</i> in year <i>y</i>
Source of data used:	Calculated based on the most recent data.
Value applied:	0.52
Justification of the choice of data or description of measurement methods and procedures actually	The grid emission factor is calculated using the “Tool to calculate the emission factor for an electricity system,” according to AMS.I.D. (version 13). A combined margin is selected, and the simple OM method is applied. For OM, ex-ante option of Step 2 and Option (A) of Step 3 of the Tool are selected for the calculation. For BM, Option 1 of Step 4 is selected. See Annex 3 for

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 7

applied :	details.
Any comment:	---

Data / Parameter:	T_1
Data unit:	(°C)
Description:	Inlet water temperature
Source of data used:	Local water supply company
Value applied:	28
Justification of the choice of data or description of measurement methods and procedures actually applied :	The ECC will collect data on the average temperature of tap water supplied by the local water company.
Any comment:	---

Data / Parameter:	T_2
Data unit:	(°C)
Description:	Outlet water temperature
Source of data used:	Calculated based on available solar radiation and SWH system efficiency.
Value applied:	60
Justification of the choice of data or description of measurement methods and procedures actually applied :	This value is calculated based on historical solar radiation data in a province and the average efficiency of the SWH systems.
Any comment:	---

Data / Parameter:	M
Data unit:	Kg
Description:	Volume of hot water consumed per day
Source of data used:	The ECC
Value applied:	180
Justification of the choice of data or description of measurement methods and procedures actually applied :	The ECC will collect and record the tank size of each installed SWH system. The CPA includes only systems over 180 liters in capacity; 180 liters is a conservative estimate.
Any comment:	---

Data / Parameter:	D
Data unit:	(d /yr)
Description:	Operating days per year

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:
Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 8

Source of data used:	The ECC
Value applied:	365
Justification of the choice of data or description of measurement methods and procedures actually applied :	Once a SWH system is installed, it will operate everyday. The ECC will monitor whether the system is operating or not annually.
Any comment:	---

B.5.2. Ex-ante calculation of emission reductions:

Emission reductions

The emission reductions counted for this proposed CPA will be the electricity saved by using solar water heating systems (SWH), instead of electricity imported from the grid for heating water used by consumers.

$$ER_y = BE_y = EG_y \times EF_{EL,y} \quad (1)$$

Where:

Parameter	Value	Unit	Description
ER_y		(tCO ₂ e /yr)	Emission reductions in year y
BE_y		(tCO ₂ e /yr)	Baseline emissions from heat displaced by the SSC-CPA during the year y
EG_y		(MWh /yr /unit)	Electricity displaced by the SSC-CPA during the year y
$EF_{EL,y}$	0.520	(tCO ₂ e /MWh)	Emission factor for electricity grid in year y

Energy baseline

The considered energy baseline will be the electricity consumed from the grid, which would be saved by installing the SSC-CPA SWH system, is as follows:

$$EG_y = N \times EC_{y,BL} = N \times [m \times d \times 4.186 \times (T_2 - T_1)] / 3,600,000 \quad (2)$$

Where:

Parameter	Value	Unit	Description
N		[units]	Number of devices
$EC_{y,BL}$		(MWh /yr /unit)	Electricity displaced by the unit of the device under SSC-CPA in the year y
m	180	(kg/d)	Volume of hot water consumed per day
d	365	(d /yr)	Effective operating days per year
	4.186	(kJ /kg /°C)	Specific heat capacity of water

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:
Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 9

T_2	60	(°C)	Temperature of water after heating
T_1	28	(°C)	Temperature of water before heating
	3,600,000	(kJ /MWh)	Conversion factor

$$EC_{y,BL} = 2.44 \text{ (MWh /yr /unit)}$$

The volume of water consumed is based on the tank capacity of the SWH system; 180(kg/d) is the minimum capacity of SWH systems included in this CPA. The inlet temperature of water is given by the local water supply company. The outlet temperature of water was calculated using the average daily solar radiation, and energy conversion efficiency of the solar collectors of SWH systems.

Grid emission factor

Emission factor of the connected grid is calculated using AMS I.D. (Version 13). The baseline emission factor is calculated as the combined margin, consisting of combination of operating margin and build margin factors calculated using the latest version of the “Tool to calculate the emission factor for an electricity system” as follows:

Step 1. Identify the relevant electric power system

The electricity displaced by the CPA will be delivered from the Vietnamese national grid, the only grid that exists in the country.

Step 2. Select an operating margin (OM) method

As no dispatch data is available and must-run/low cost resources constitute less than 50% of total grid generation over the past 5 years, the simple OM method is used (See table A3.1 in Annex 3). For the simple OM, ex-ante option is selected.

Step 3. Calculate the operating margin emission factor according to the selected method

The simple OM emission factor is calculated based on fuel consumption and net electricity generation of each power plant/unit (Option A). The following formula is used to calculate Simple OM.

$$EF_{grid,OMsimple,y} = \frac{\sum_{i,m} FC_{i,m,y} \cdot NCV_{i,y} \cdot EF_{CO2,i,y}}{\sum_m EG_{m,y}} \quad (3)$$

Where:

Parameter	Unit	Description
$EF_{grid,OMsimple,y}$	(tCO ₂ e /MWh)	Simple operating margin CO ₂ emission factor in year y
$FC_{i,m,y}$	(kt)	Amount of fuel type <i>i</i> consumed by power plant/unit <i>m</i> in year y
$NCV_{i,y}$	(TJ/kt)	Net calorific value (energy content) of fossil fuel type <i>i</i> in year y
$EF_{CO2,i,y}$	(tCO ₂ e /TJ)	CO ₂ emission factor of fossil fuel type <i>i</i> in year y (tCO ₂ /GJ)
$EG_{m,y}$	(MWh)	Net electricity generated and delivered to the grid by power

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:
Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 10

<i>m</i>	plant/unit <i>m</i> in year <i>y</i> (MWh) All power plants/units serving the grid in year <i>y</i> except low-cost/must-run power plants/units
<i>i</i>	All fossil fuel types combusted in power plant/unit <i>m</i> in year <i>y</i>
<i>y</i>	The three most recent years for which data is available at the time of submission of the CDM-PDD to the DOE for validation (ex-ante option)

The operating margin emission factor calculations are performed ex-ante using available official data on fuel consumption and electricity generation for each plant connected to the Vietnamese national grid in 2005-2007. All data is summarized in table A3.2 in Annex3.

The “Operating Margin” emission factor will be:

$$EF_{OM} = 0.594 \text{ tCO}_2/\text{MWh}$$

Step 4. Identify the cohort of power units to be included in the build margin

For the CPA, the sample group of power units *m* used to calculate the build margin consists of the set of power capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently. In terms of vintage of data, Option 1 (ex-ante) was selected for this CPA.

Step 5. Calculate the Build margin emission factor

The build margin is calculated as the generation-weighted average emission factor (tCO₂/MWh) of sample of power plants as follows:

$$EF_{grid,BM,y} = \frac{\sum_m EG_{m,y} \times EF_{EL,m,y}}{\sum_m EG_{m,y}} \quad (4)$$

Where:

Parameter	Unit	Description
$EF_{grid,BM,y}$	(tCO ₂ e /MWh)	Build margin CO ₂ emission factor in year <i>y</i>
$EG_{m,y}$	(MWh)	Net quantity of electricity generated and delivered to the grid by power unit <i>m</i> in year <i>y</i>
$EF_{EL,m,y}$	(tCO ₂ /MWh)	CO ₂ emission factor of power unit <i>m</i> in year <i>y</i>
<i>m</i>		Power units included in the build margin
<i>y</i>		Most recent historical year for which power generation data is available

For the proposed CPA, Option 1 shall be chosen: Calculate the Build Margin emission factor $EF_{grid,BM,y}$ ex-ante based on the most recent information available on plants already built for sample group *m* at the time of PDD submission. The sample group of power unit *m* used to calculate the build margin consists of

**SMALL-SCALE CDM PROGRAMME ACTIVITY DESIGN DOCUMENT FORM
(CDM-SSC-CPA-DD) - Version 01**

NAME /TITLE OF THE PoA:
Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 11

the set of power capacity additions in the electricity system that comprise 20% of the system generation (in GWh) and that have been built most recently. Data for the build margin calculation is shown in the table A3.3 in Annex 3.

The build margin emission factor will be:

$$EF_{BM} = 0.446 \text{ tCO}_2/\text{MWh}$$

Step 6. Calculate the combined margin baseline emission factor

The combined margin emission factor is calculated as follows:

$$EF_{grid,CM,y} = EF_{grid,OM,y} \times w_{OM} + EF_{grid,BM,y} \times w_{BM} \tag{5}$$

Where:

Parameter	Unit	Description
w_{OM}	(%)	Weighting of the operating margin emission factor
w_{BM}	(%)	Weighting of the build margin emission factor
w_{OM} and w_{BM} , by default, are both valued at 50%		

The baseline emission factor will be:

$$EF_{EL,y} = 0.520 \text{ tCO}_2/\text{MWh}$$

Emission reductions per system are calculated as follows:

$$ER_y = 2.44 \text{ (MWh/yr/unit)} \times 0.520 \text{ (tCO}_2\text{e/MWh)}$$

$$= 1.27 \text{ (tCO}_2\text{e /yr /unit)}$$

Based on the projected installation schedule of the ECC-HCMC, the annual emissions reductions will be as follows:

<i>Year</i>	<i>SWH Installed</i>	<i>Total SWH</i>	<i>ER_y</i>
1			
2			
3			
4			
5			
6			
7			
	[units]	[units]	(tCO ₂ e /yr)

Installing Solar Water Heating Systems in the South of Viet Nam

CDM – Executive Board

page 12

Project emissions

As the heat is sourced from a renewable resource, there are no project emissions from the proposed CPA.

Leakage

There is no leakage from this CPA.

B.5.3. Summary of the ex-ante estimation of emission reductions:

Year	Estimation of project activity emissions (tCO ₂ e)	Estimation of baseline emissions (tCO ₂ e)	Estimation of leakage (tCO ₂ e)	Estimation of overall emission reductions (tCO ₂ e)
1				
2				
3				
4				
5				
6				
7				
Total (tCO₂e)				

B.6. Application of the monitoring methodology and description of the monitoring plan:

B.6.1. Description of the monitoring plan:

The monitoring methodology for the category AMS-I.C. “Thermal energy for the user with or without electricity” is applied for this proposed CPA. The methodology consists of the following:

If the emissions reduction per system is less than five (5) tonnes per year:

- Recording annually the number of systems operating (evidence of continuing operation, such as on-going rental/lease payments could be a substitute); and
- Estimating the annual hours of operation of an average system, if necessary using survey methods. Annual hours of operation can be estimated from total output and output per hour if an accurate value of output per hour is available.

As the emission reduction for each SWH system under this CPA is 1.27 tCO₂e/year which is less than 5 tCO₂e/year, the following values will be monitored:

The ECC will keep a record of all monitoring data. The figure in Annex 4 shows the monitoring structure for the proposed CPA and the monitoring procedure is explained below:

1) The ECC will keep a record of the number, location, type, and owner of all SWH systems installed. The owners of the SWH systems are required to report to distributors to fix systems if they have any problems. SWH system distributors need to report any information on system problems and the number of days that systems do not operate. Then, the ECC will add information on the systems which have problems into their database to keep an up-to-date record of all operating systems.

2) The ECC will also collect data on the sunny hours per day from the Meteorological Center in the province where the proposed CPA is located and then calculate the sunny hours per year.

A database will be set up the by the ECC for the proposed CPA. The database will include the following information for each SWH system:

- Location of SWH system registered under the proposed CPA;
- Name of the SWH system owner;
- Installation date of the SWH system;
- Distributor and technical specifications of the SWH system;
- SWH system serial number;
- The dates when system stops operation and restarts operation;
- The reason for any system problems.

SECTION C. Environmental analysis

C.1. Please indicate the level at which environmental analysis as per requirements of the CDM modalities and procedures is undertaken. Justify the choice of level at which the environmental analysis is undertaken:

Please tick if this information is provided at the PoA level. In this case, sections C.2. and C.4. need not be completed in this form.

C.2. Documentation on the analysis of the environmental impacts, including transboundary impacts:

N/A

C.3. Please state whether an environmental impact assessment is required for a typical CPA, included in the programme of activities (PoA), in accordance with the host Party laws/regulations:

N/A

Annex 3

BASELINE INFORMATION

Information regarding the calculation of the electricity grid emission factor:

Table A3.1. Rate of low cost/must-run sources based on generation

Year	2003	2004	2005	2006	2007	Average
Hydro power generation (GWh)	19,033	17,979	16,437	19,573	22,178	19,040
Total generation (GWh)	40,636	46,800	53,407	60,489	68,725	54,011
Rate of low cost/must-run sources (%)	46.84	38.42	30.78	32.36	32.27	35.25

Table A3.2. Electricity outputs and fuel consumptions of thermal power sources in 2005– 2007⁵

Fuel Type		2005	2006	2007
Coal NCV = 22.19 TJ/kt* CO ₂ EF = 94.6 tCO ₂ /TJ –IPCC-2006	GWh	9,446	10,808	11,415
	kt	4,857	5,643	5,896
	kt CO ₂	10,083	11,581	12,032
Gas Turbine (Gas) CO ₂ EF = 54.3 tCO ₂ /TJ –IPCC-2006	GWh	24,031	26,786	28,807
	TJ	179,472	204,133	212,945
	kt CO ₂	9,745	11,084	11,563
Diesel Oil NCV = 42.7 TJ/kt CO ₂ EF = 72.6 tCO ₂ /TJ – IPCC-2006	GWh	482	261	601
	kt	136	73	169
	kt CO ₂ e	422	228	523
Fuel Oil NCV = 41.45 TJ/kt CO ₂ EF = 75.5 tCO ₂ /TJ –IPCC-2006	GWh	2,638	2,095	3,094
	kt	722	574	846
	kt CO ₂ e	2,259	1,797	2,649
Imported electricity	GWh	373	966	2,630
Total CO2 emission from Viet Nam grid	kt CO ₂ e	22,509	24,691	26,766
Total thermal electricity output generated	GWh	36,970	40,916	46,547

*22.19 TJ/kt is used for all coal power plants except for the following:

Na Duong: 14.65

Cao Ngan: 18.84

Formosa: 25.96

Table A3.3. The power plant capacity additions in the electricity system that comprise 20% of the system generation (in GWh) and that have been built most recently⁶

No	Plant name	Commissioning year	Capacity (MW)	Output (GWh)	Energy type	Emission (kt CO ₂)
1	Quang Tri	2007	64	64	Hydro	-
2	Ca Mau	2007	720	691	Gas	244
3	Cai Lan (Quang Ninh)	2007	40	81	Fuel oil	71
4	Se San 3a	2007	108	345	Hydro	-
5	Srok Phu Miêng	2006	51	252	Hydro	-
6	Cao Ngan*+(IPP) PC1	2006	100	445	Coal	442
7	Uong Bi 2	2006	300	520	Coal	458
8	Se San 3	2006	260	1,113	Hydro	-
9	Dam Phu My (IPP) PC2	2005	150	150	Gas	58
10	Na Duong*+(IPP) PC1	2004	110	744	Coal	763
11	Fosmosa	2004	150	1,113	Coal	864
12	Phu My 4	2004	450	3,142	Gas	1,411
13	Phu My 2-2	2004	720	5,004	Gas	1,937
14	Can Don	2003	259	361	Hydro	-
	Total			14,025		6,248

MONITORING INFORMATION

Other monitoring information is found in Section B.6.1. The monitoring structure is shown as follows:
